Key & Lock

Material Speculation/Critical Design

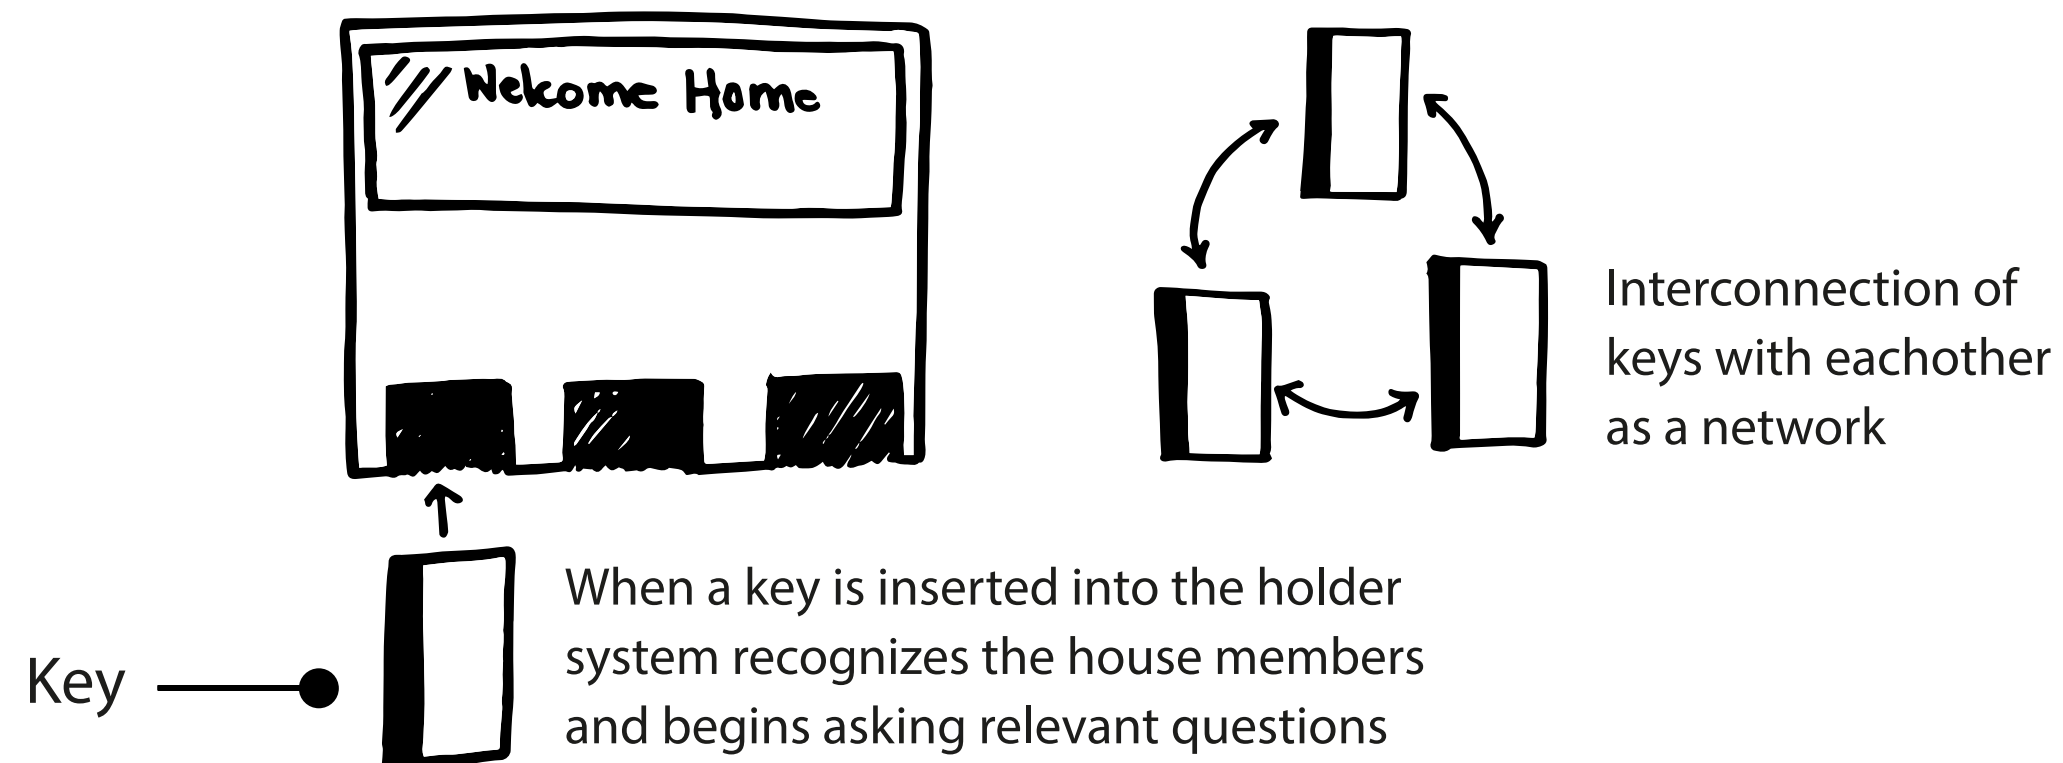

A key & lock system where access into the house is granted through fingerprint identification and specific questions about your personal daily itinerary. The key geotags your location at certain points of your trip and will verify the authenticity of your answer.

Key & Lock

Material Speculation/Critical Design

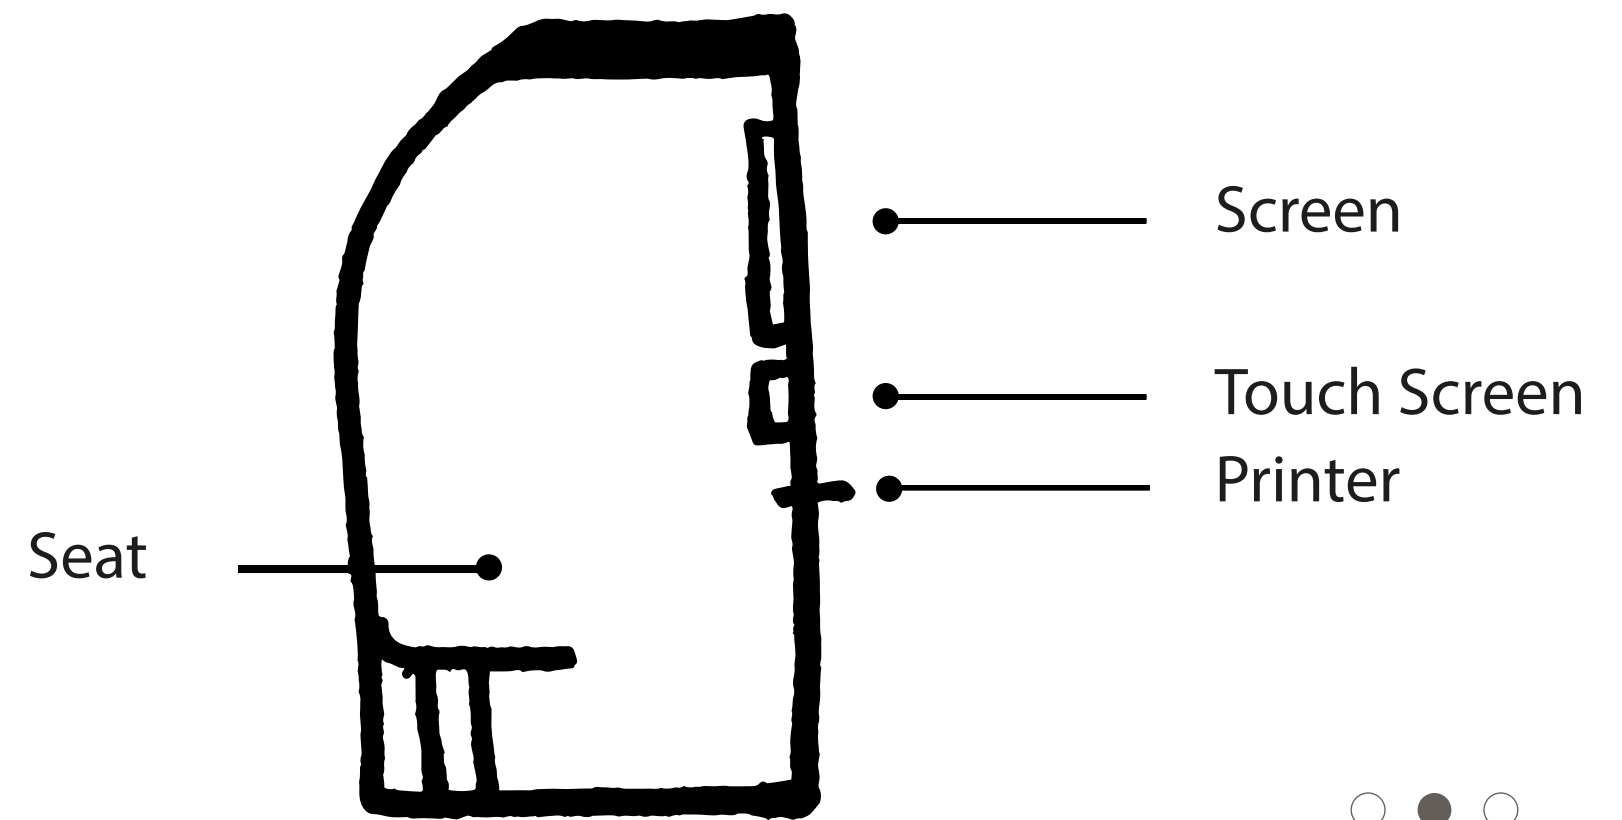

Current standards for security can be improved drastically by making the key to our homes our very identity. However, by elevating security, it means having to validate ourselves to automated systems that have intimate knowledge of us and our lives. This would be implemented into a home context to replace the existing key & lock system.

Interactive Photo Booth

Ludic/Critical Design

A photo booth that takes the user's photo and prompts the user into doing a playful personality test used to personalize the aesthetic retouching of their photo. The booth then prints out the user's photo and information as well as all the previous photos and profiles of people that have interacted with it. The concept aims to highlight the ease with which personal information can be shared and spread.

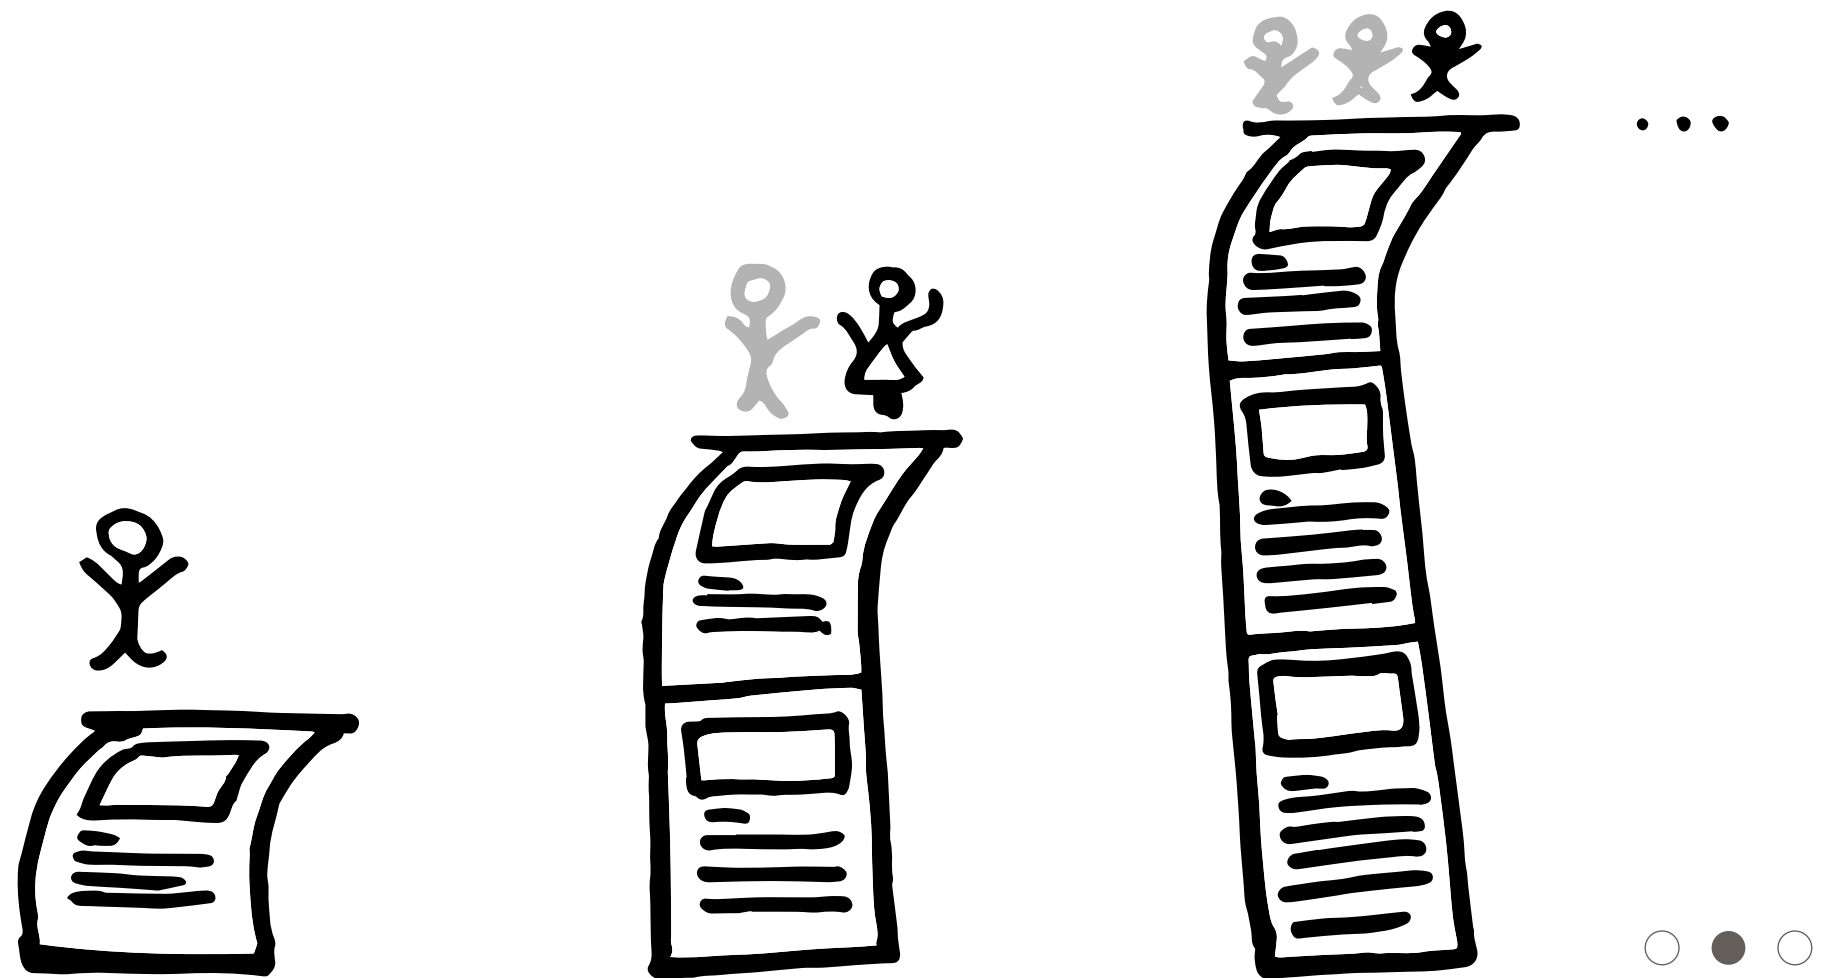

Interactive Photo Booth

Ludic/Critical Design

It is easy to coax valuable information and private details out of a person in exchange for recreation.

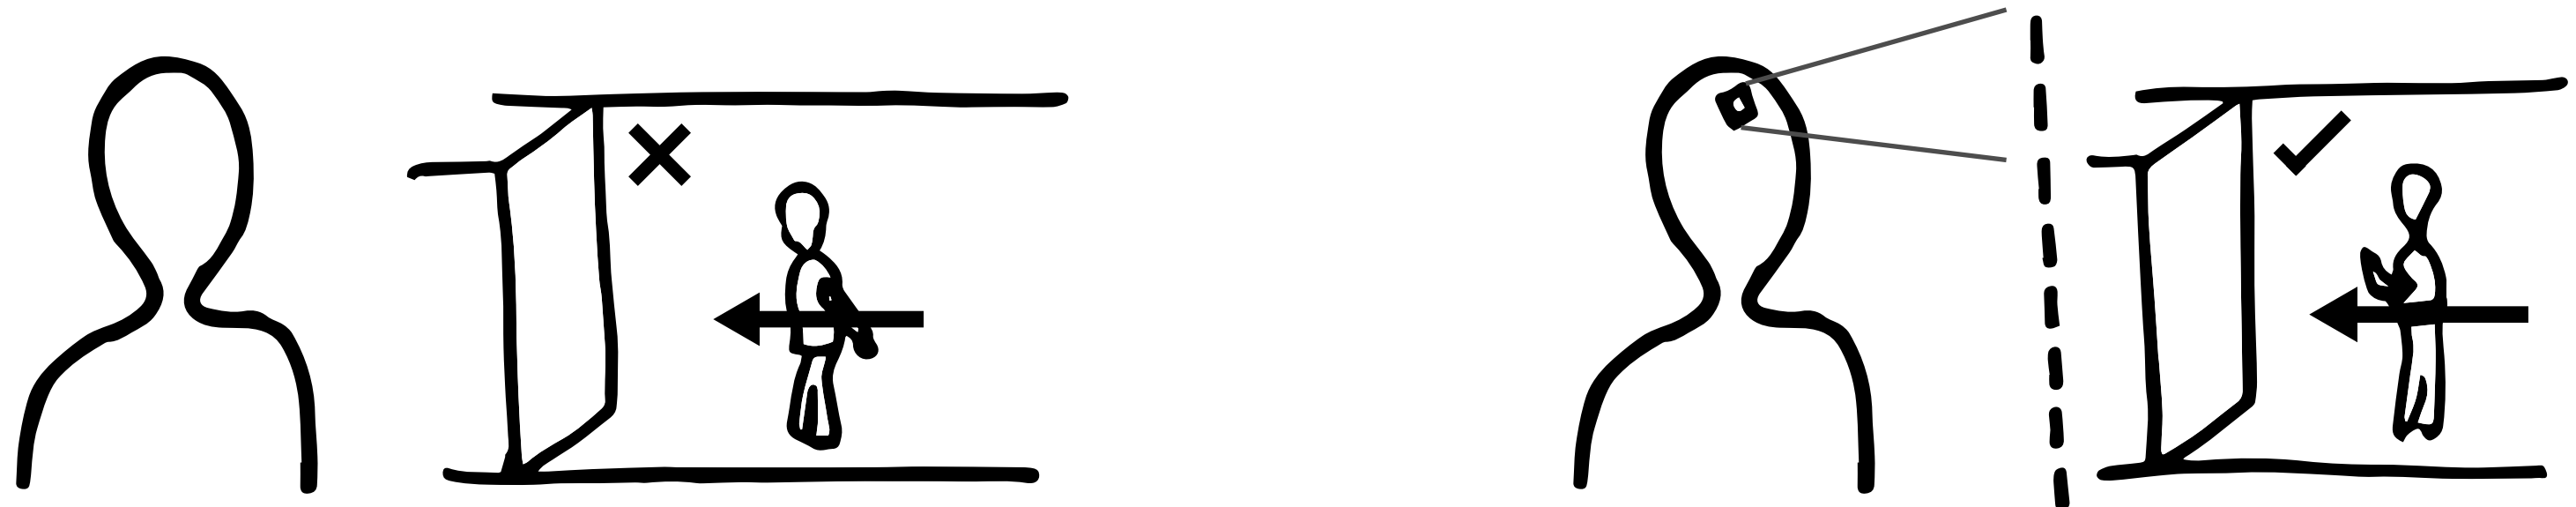

How comfortable would people be if they could clearly see what others know about them after a simple and fun interaction? This is targeted at people who aren't aware how much of their privacy they are parting with in their pursuit for entertainment.

HOME SECURITY SYSTEM

Design Fiction

A futuristic home security system that identifies its residents through a biological implant and keeping a detailed profile of every member, and hides all furniture and belongings when no one is present. This concept aims to bring awareness to the amount of trust we should put into technology with safeguarding and using our personal information and valuables.

HOME SECURITY SYSTEM

Design Fiction

Having total security is always a trade-off: in order for the security system to reliably protect your property, it needs to have complete knowledge of you as a person. What prices are we willing to pay in order to ensure security over our property? This concept would be represented in a fictional ad format, with brochures and a model as supplementary material to sell the speculative product.
