Abstract / Summary

This user friendly application intends to provide an easy framework for creating and maintaining an inventory for businesses, shop owners or individuals. Through this application the user can create new items as objects and add them to groups or lists with one click. The number of added items can be adjusted at any time to add or remove items. Groups and lists can be created and customized by the user. Some general items and groups will be provided to get them started.

Overview

This application can be useful because maintaining an inventory is a tough task if done the traditional way since the items and quantities constantly change. Using a mobile application with a unique interface will make maintaining the inventory easier in a neat and organized manner. Not much prior experience and knowledge is required for using this application, it is self explanatory.

Purpose of the application

This application will be under the Utility category and it is designed to make organization and management of items easier for users. Dynamic customization and personalization of the application allows the user to skip the tough task of keeping up with inventory changes. Also they can be alert of quantity changes and remaining available items.

Context of the application

Our main audience will be using this application while walking around the inventory or sitting down at their workplace. We can assume the item creation and list building part of the application will be used on certain days during the inventory count period but the user will be regularly updating and maintaining their inventory at various time and places. Since we are developing for android systems, we will focus on making the application as customizable as possible, because that is the preference of android users.

Functionality

Basic Functionality

- The app should run smoothly: find
- Error handling: should not crash
- Have GetStarted package: general categories, lists and items
- Create items: add images, name, type and customized field for item
- Create lists: picture, category, name, customized field for item
- Create custom categories

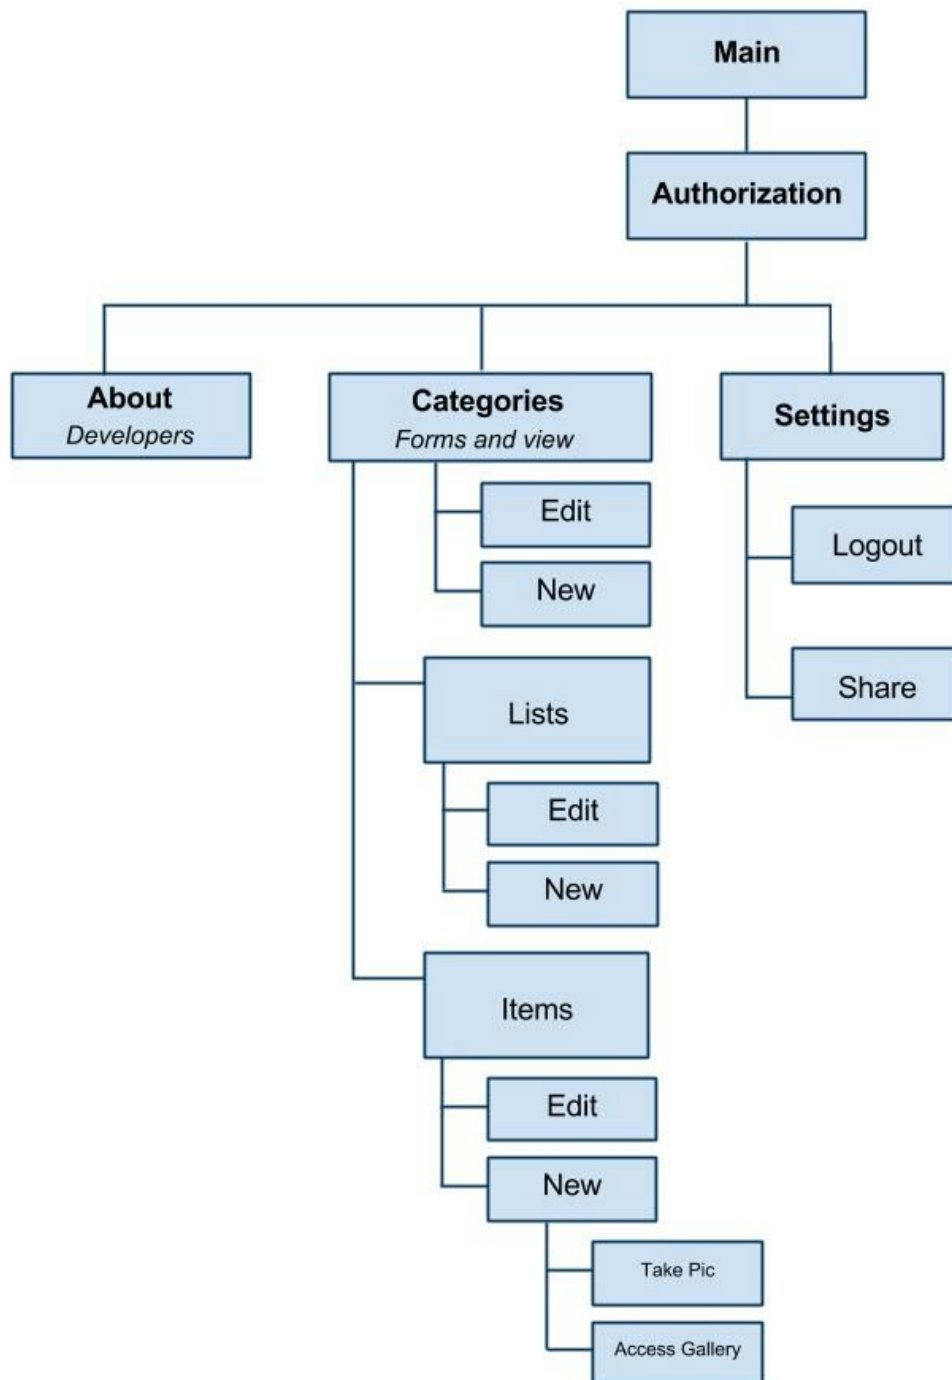

Standard Functionality

- Compatible with as many devices as possible order list what to order
- Send push notification to users
- Web application for desktop access
- Have outside links for buying or ordering items
- Implement tabs

Bonus Functionality

- Create home page widget for the application
- Optimize use of memory
- Enable customers to login as visitors and see availability of items (optional feature for users.)
- Add extra notes for specific items

Structure of your application

Work distribution and timeline

We will work on every step as a group but here is what each of us will focus on

Interface: Azat **XML:** Saleh **Java:** Nika

Week 7:

- Design and code the xml for each activity layout
- Create UML diagram

Week 8:

- Design, create and discuss database
- Research and practice with required hardware connection

Week 9:

- Implement Get Started package
- Add sample general categories, lists and items

Week 10:

- Complete xml codes
- Add activities for customized categories, lists and items

Week 11:

- Compatible with as many devices as possible order list what to order
- Send push notification to users
- Web application for desktop access
- Have outside links for buying or ordering items

Week 12:

- Create home page widget for the application
- Optimize use of memory

Week 13:

- Enable customers to login as visitors and see availability of items (optional feature for users.)
- Add extra notes for specific items
