

IAT 352 - Final Project Proposal - Nika Lohrasbi Azar

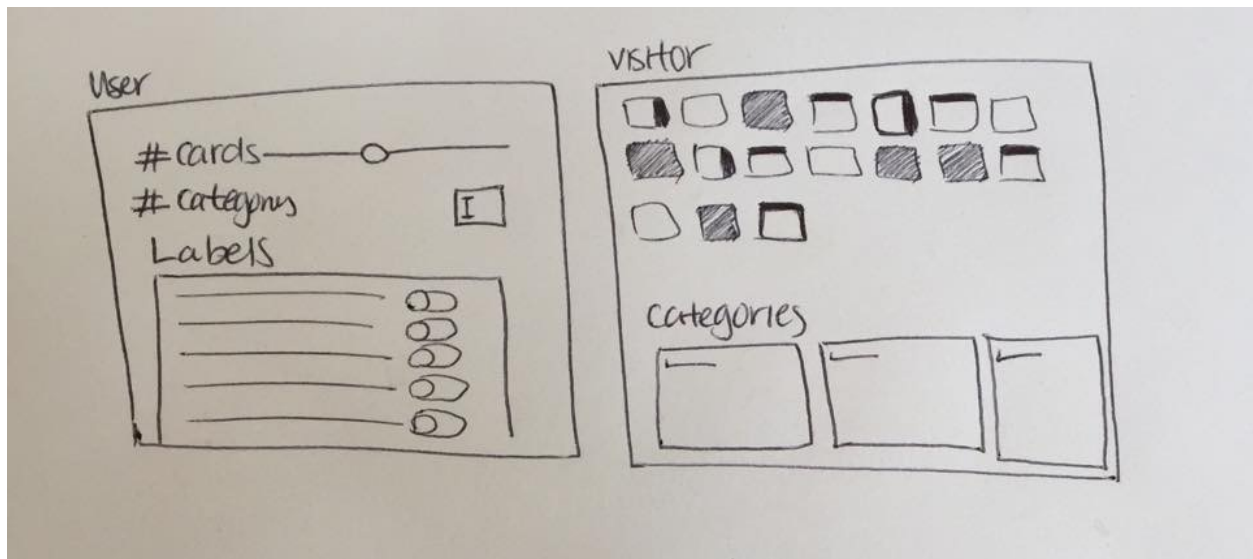

Problem: it is tough for designers to set up user testing frameworks and reach their desired audience to complete their research. I will be easier for them to work within an application to generate professional user testings and just share a link to reach out to audience. On the other hand visitors can just visit the website to take part in tests.

A web application that provides a framework for designers and developers to do user experience testing. Clear framework will allow the designer to set their desired test professionally and quickly. The results will be presented to the designer with graphics and charts, automatically and dynamically. This application offers various testing methods:

Card sorting

the user will define the number of cards, labels and number of categories and any extra requirements in a clear and quick way

the visitor will choose the test of interest and is able to easily complete the task in a friendly environment and with clear instructions.

Surveys

the user will be setting questions and types of answers (multiple choices, scales, text, etc.) and provide possible answers within certain limits and guidelines. The survey will then be generated into an interactive and interesting task for the visitor.

The visitors will be directed to appropriate surveys and are able to quickly complete them.

The image shows two hand-drawn wireframes for user and visitor forms. The 'user' form on the left includes a 'Question:' label, an input line, an 'answer type:' label, three input boxes, and an 'answers:' label with a '1.' label and an input line. The 'visitor' form on the right includes a 'Q1.' label, a slider with 'least' and 'very' labels, a 'Q2.' label, 'Yes' and 'No' buttons, a 'Q3.' label, and four numbered input boxes (1, 2, 3, 4).

Tree testing (reverse card sorting)

Similar flow.

First impression tests

Members:

Will be able to sign up,
 choose categories for their test
 Choose the type of test they are interested in generating
 follow instructions and set up the test
 choose the style and type of result they want
 choose the method they want to receive updates
 choose the milestone or threshold they want to receive updates on the results
 will be able to log in and check the results as often as they desire
 they may provide keywords for their test.

Visitors:

will be able to choose the type of survey they would like to participate in
 they would be able to be redirected to a certain survey right away
 they can search by keywords and find tests
 will be able to complete tests and have a confirmation or a link to provide proof of completion

Project challenge:

Deciding what the reward will be for the visitor, what attracts them to complete surveys?

Possible choices:

1. Users must pay to post surveys and visitors will be given rewards that way. Therefore any user will be completing any survey they are interested in
2. the website only provides a platform for users to generate tests and they will reward participants upon completion. Therefore users/designers are expected to reach out to their audience themselves.
